What is a repository?

A repository is a project containing files and folders. It tracks versions of files and folders.

What is a branch?

A branch is a parallel version of your repository. You can use branches to have different versions of a project at one time. On additional branches, you can make edits without impacting the main version. In other words, everyone's work is safe while you contribute.

ABmag not documented on units page #8244

Edit New issue

Open parejkoj opened this issue on Dec 6, 2018 · 2 comments

parejkoj commented on Dec 6, 2018

Member + ...

The `ABmag` unit is mentioned twice on the [logarithmic units page](#), but has no documentation and is not even mentioned on the [main units page](#).

@pllim made sure that the new [photometry units documentation](#) got into the release.

@mhvk was mentioned as who to contact about getting ABmag documented there.

pllim added `units` `Docs` labels on Dec 6, 2018

mhvk commented on Dec 6, 2018

Member + ...

Indeed, we now at least include <http://docs.astropy.org/en/latest/units/index.html#module-astropy.units.photometric> - but that doesn't mention any of the `mag*` actual logarithmic units.

Add equality for representations (to fix #8138) #8205

New issue

Member

This fixes [#8138](#) by adding an equality comparison for representation objects. Some implementation notes:

- It does the reasonable thing of converting to cartesian if the two objects aren't the same
- It yields False (not TypeError) if the right-hand-side is not a representation
- It does *not* try to do fancy differential-converting - it will only return True if the classes of the representation match and the differentials are all equal.

Note that this is high priority as it is currently a blocker for release of 3.1 because it fixes [#8138](#) (somewhat counter-intuitively by creating a new feature

cc @adrn @bsipocz @astrofrog (the latter mostly because it probably needs a 👍 since we're post feature-freeze... although debatable since it's both a new feature *and* a bug fix?)

mhvk 18 days ago Member

I'd not be against solving this on the `Time` side - @taldcroft - what do you think? It would not be difficult (but definitely in another PR).

mhvk 18 days ago Member

Actually, `col` here is an astropy `Column`, which should sandwich the bytes already, so I think that this doesn't work automatically is a buglet.

mhvk 18 days ago Member

See [#6823](#) for a fix. I think it is fairly trivial, so perhaps we can merge it before this PR, so that this change no longer is necessary.

astrofrog 18 days ago Owner

@mhvk - sounds good!

taldcroft 4 hours ago Owner

[#6823](#) is merged now.

astropy affiliated packages

Astronomy Python packages that are not part of the **Astropy core package** but have requested to be a part of the **Astropy project**

Agree to good coding standards (testing, documentation),
reduce duplication, open development

Use **astropy** when possible to improve interoperability

affiliated.astropy.org

General rules of thumb

Check the **issues** and **affiliated packages** page before proceeding

You may be duplicating some one else's work

Adhere to PEP-8 and similar **best coding practices**

i.e., Make your code readable!

Work in a branch (of your own fork) with an informative name

Submit pull requests from that branch

Leave files that cannot be "diffed" (e.g., fits, png, pdf) **out** of the repo

If they are absolutely necessary, use download or talk to an Astropy lead

Clear all outputs on jupyter notebooks (.ipynb) before any commit

This allows them to be "diffed"

If you forget, use git rebase to clear up the git history
